

**AMENDMENTS TO THE SPECIFICATION**

Please replace the following after “Background” on page 1:

[0004] The Semantic Web is an evolving collection of knowledge, which provides information on the Internet, or World Wide Web in such a way that it can be readily used by intelligent agents and other computer programs. Information on the Semantic Web, rather than being in natural language text, can be maintained in a structured that both computers and people can work with. The Resource Description Framework (RDF) from the World Wide Web Consortium (W3C) underlies most Semantic Web efforts. RDF consists of statements (subject/predicate/object triples) made about instances of specific classes (similar to an object-oriented programming language).
